# Analysis on Hydropower Dilemma in Nepal

---

Presented By:

**Sushil Aryal, PhD**

14<sup>th</sup> February 2025

- I. Introduction
- II. Methodology
- III. Base Year Energy Balance and Scenario Assumptions
- IV. Results and Discussions
- V. Conclusion

# I. Introduction

## Background

- Electricity scenario of Nepal is dismal despite abundant hydropower potential
- Ambitious Targets
  - SDG – 15 GW Hydropower and per capita consumption 1500 kwh by 2030
  - COP 26 – Net zero emission by 2045
  - NDCs - Reduce energy sector emissions by end-use electrification across all economic sectors
  - Energy Development Roadmap 2024 – 28.5 GW hydropower by 2035 (15 GW – export)
- Targets – more supply focused
- Hydropower targets not coupled with end-use electrification strategies
- Hydropower for domestic consumption or exports – often debated in Nepal.

### Hydropower potential in Nepal in GW

### Nepal's Energy Mix

Source: (MoF, 2025)

## Objectives of the study

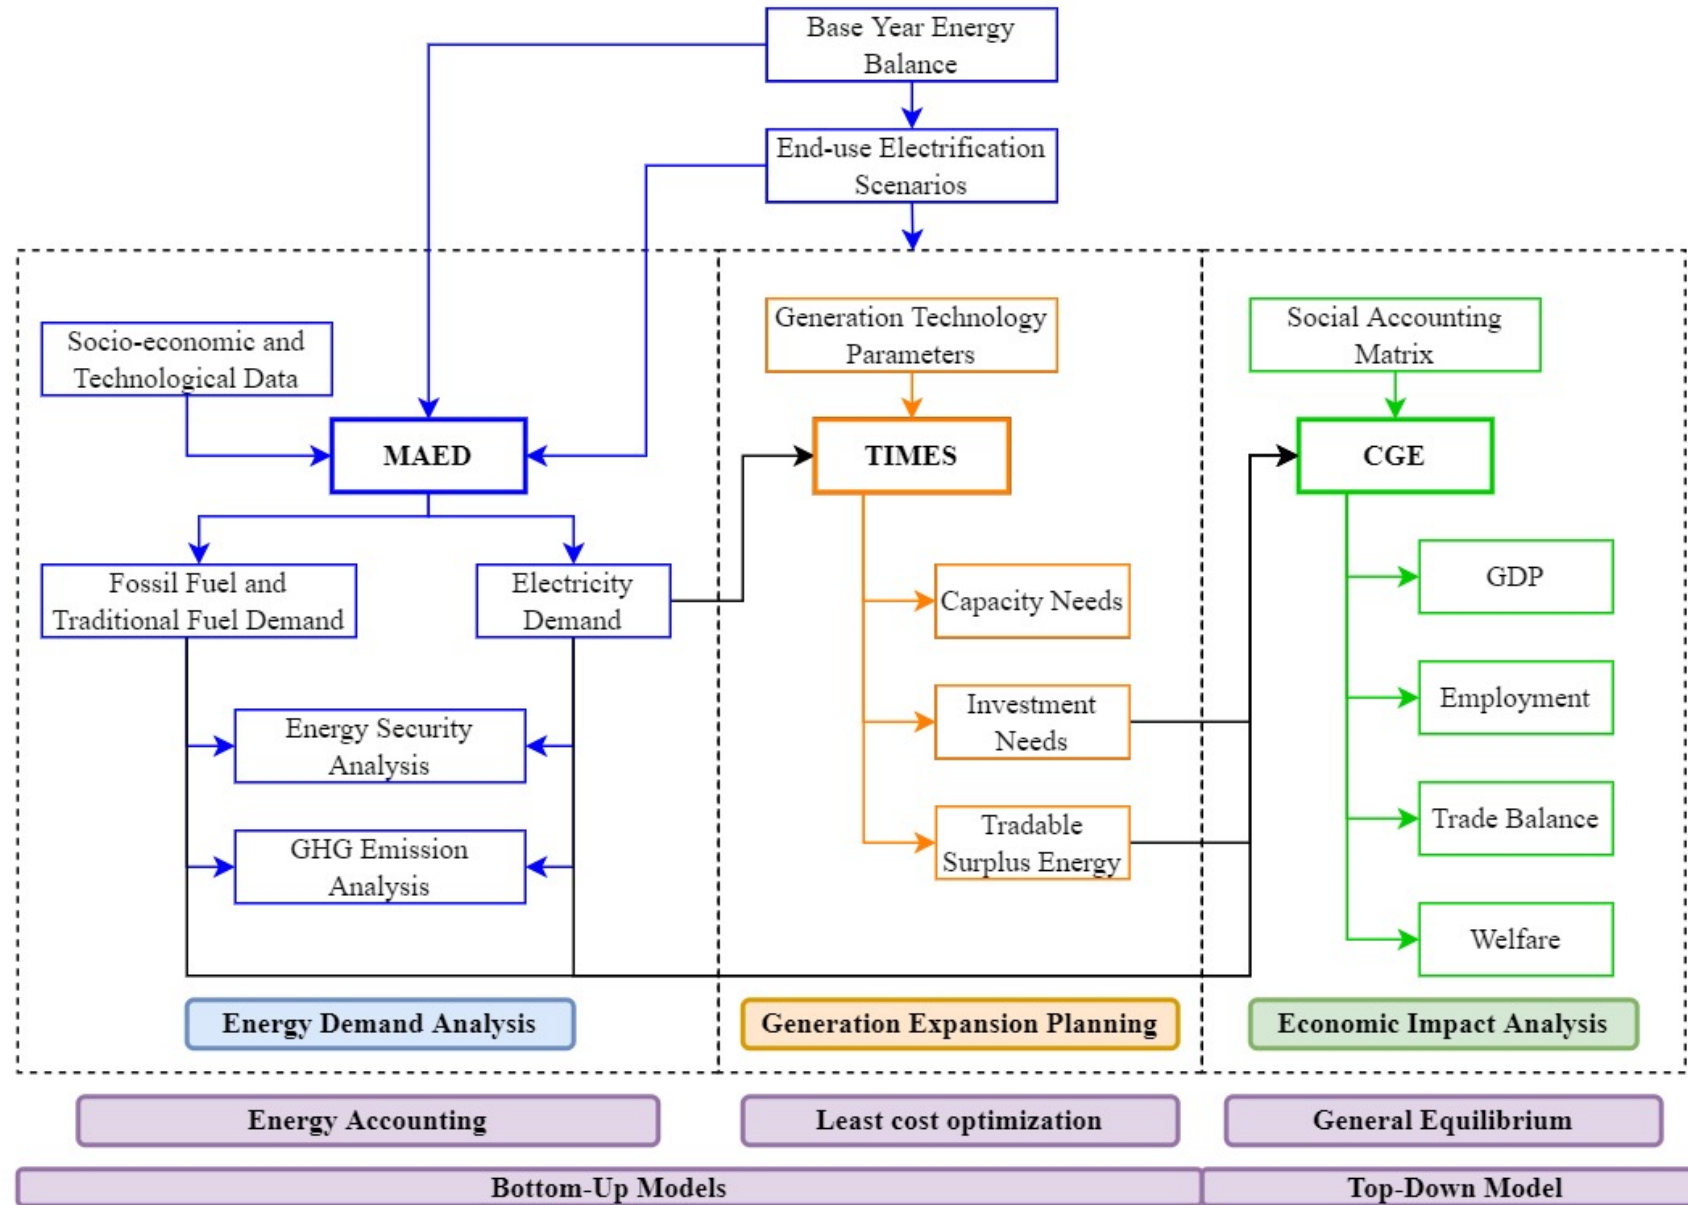

### **Overall Objective:**

- To analyze the implications of integrating end-use electrification (EEU) and cross-border electricity trade (CBET) policies on energy system and economy of Nepal.

### **Specific Objectives:**

1. To project Nepal's long-term energy demand under various scenarios of end-use electrification across all the economic sectors.
2. To carry out least cost generation expansion planning for Nepal under various demand scenarios and estimate the capacity, investment needs and tradable surplus energy.
3. To examine the macroeconomic impacts of hydropower investments in terms of GDP, employment, trade balance and welfare.

## II. Methodology

Overall methodological  
framework of the study

# III. Energy Balance and Scenario Assumptions

## Base Year Energy Balance (2020,PJ)

Source: Author's Calculation

## Scenario Assumptions

**Table:** Scenario Assumptions based on Sectoral End-use Electrification Levels by 2050

| Scenarios | Transport |         | Household cooking and heating | Industrial and Service <sup>b</sup> |
|-----------|-----------|---------|-------------------------------|-------------------------------------|
|           | Passenger | Freight |                               |                                     |
| 2020      | < 1%      | 0%      | 4%                            | 4%                                  |
| ETL       | 20%       | 10%     | 20%                           | 20%                                 |
| ETM       | 50%       | 30%     | 50%                           | 50%                                 |
| ETH       | 80%       | 60%     | 80%                           | 80%                                 |

<sup>a</sup>Electrification level is modeled as modal split shares of electric land transport modes.

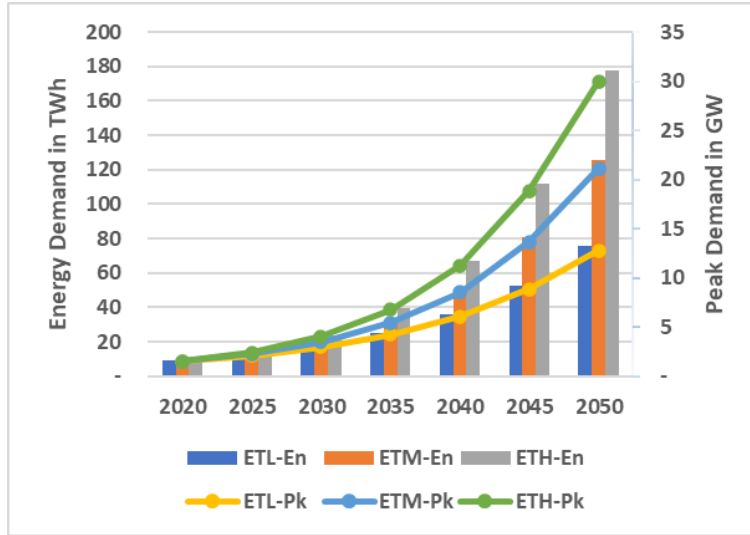

<sup>b</sup>Thermal needs of agriculture, construction, mining, manufacturing, and service sectors

Electrification Speed →

| 2025 | 2030 | 2035 | 2040 | 2045 | 2050 |
|------|------|------|------|------|------|
| 5%   | 15%  | 30%  | 50%  | 75%  | 100% |

# IV. Results – Energy Demand Analysis

## Electricity Demand Forecast

Energy  
Sector  
Emissions

# IV. Results – Generation Expansion Planning

## Capacity and investment Needs

(a) ETL

(b) ETM

(c) ETH

→ **Figure:**  
Generation  
Capacity Needs

**Table:** Investment Needs  
(in 2012 BUSD)

| Period  | ETL   | ETM   | ETH    |
|---------|-------|-------|--------|
| 2020-25 | 8.27  | 8.27  | 8.27   |
| 2025-30 | 3.49  | 3.80  | 4.78   |
| 2030-35 | 3.84  | 6.45  | 9.96   |
| 2035-40 | 4.88  | 10.83 | 16.67  |
| 2040-45 | 9.61  | 19.10 | 28.46  |
| 2045-50 | 14.42 | 28.05 | 42.09  |
| Total   | 44.51 | 76.50 | 110.22 |

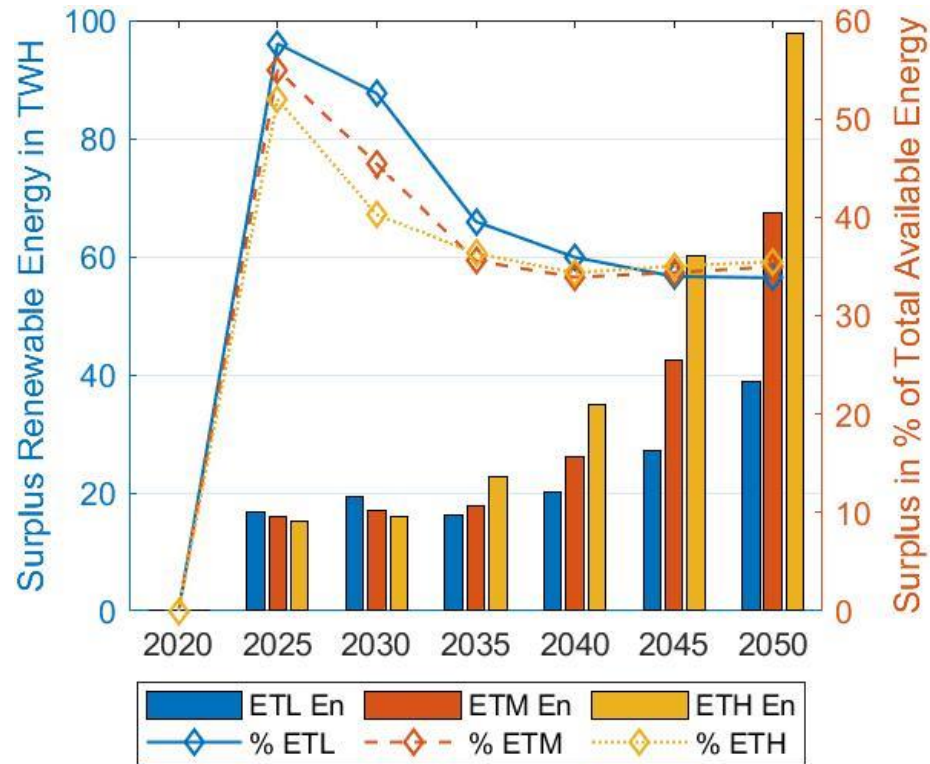

**Table:** Technological Share in Generation Mix of Nepal in 2050

| Technologies  | National Target | Least Cost Optimization Results |     |     |
|---------------|-----------------|---------------------------------|-----|-----|
|               |                 | ETL                             | ETM | ETH |
| Hydro-ROR     | 30-35%          | 64%                             | 66% | 66% |
| Hydro-PROR    | 25-30%          | 11%                             | 13% | 14% |
| Hydro-Storage | 30-35%          | 15%                             | 16% | 16% |
| Solar         | 5-10%           | 9%                              | 5%  | 4%  |

# IV. Results – Generation Expansion Planning

## Cross-border Trading of Surplus Energy

**Figure:** Surplus generation

**Table:** Annual Surplus Trade Revenue

| Years | Surplus Trade Revenue (BUSD) |      |      |
|-------|------------------------------|------|------|
|       | ETL                          | ETM  | ETH  |
| 2020  | -                            | -    | -    |
| 2025  | 1.20                         | 1.15 | 1.08 |
| 2030  | 1.39                         | 1.22 | 1.15 |
| 2035  | 1.17                         | 1.27 | 1.63 |
| 2040  | 1.44                         | 1.86 | 2.50 |
| 2045  | 1.93                         | 3.04 | 4.31 |
| 2050  | 2.77                         | 4.82 | 7.00 |

At the electricity price of 7.16 US Cents per kWh, average IEX price in June to August 2022

- Cumulative trade revenue in ETH scenario – 67 BUSD, 61% of total hydropower financing needs

# IV. Results – Generation Expansion Planning

Figure:  
Dispatch in  
ETH  
Scenario

# IV. Results – Economic Impact Analysis

- The GDP will grow at 5.4% per annum in ETL or baseline scenario.
- 5.86% in ETH-CBET scenario
- Employment increases with increase in hydropower investments.
- Trade deficit decreases in absence of CBET but increase in its presence.
- Current account balance is fixed, increase in income due to CBET revenue gives more economic space to consume imported goods.
- Growth in welfare is minimal in higher hydropower investment scenarios in absence of CBET.
- Major portion of income is used for hydro investment reducing the disposable income available for consumption.
- CBET revenue will raise the income and hence the welfare.
- CBET enables Nepal to finance hydropower projects while maximizing welfare.

Figure: *GDP Growth Rate*

**Fig:** *Change in Employment, Trade Deficit and Welfare in 2050 compared to Baseline (ETL) Scenario*

# V. Conclusion

## Summary of the Findings

- Nepal's energy targets require accelerated and widespread end-use electrification beyond 80%.
- Net zero target seems too ambitious as it will require electrification across all sector go beyond 80% in next 20 years from current level of below 5%.
- 100% renewable power mix of Nepal results in significant surplus energy even in least cost generation scenario.
- Trading surplus energy can generate up to 61% financing needs
- Integration of end-use electrification with CBET policies can have positive impacts in macroeconomic indicators.
- Domestic consumption and CBET should be integrated in policy discourse.
- The government shall act timely to place the policies and infrastructures for the end-use electrification especially in transport and manufacturing sectors to avoid the lock-in of fossil fuel.
- Negotiate with the neighboring countries to push existing bilateral CBET into the multilateral trade and regional market integration to create market for its surplus electricity.
